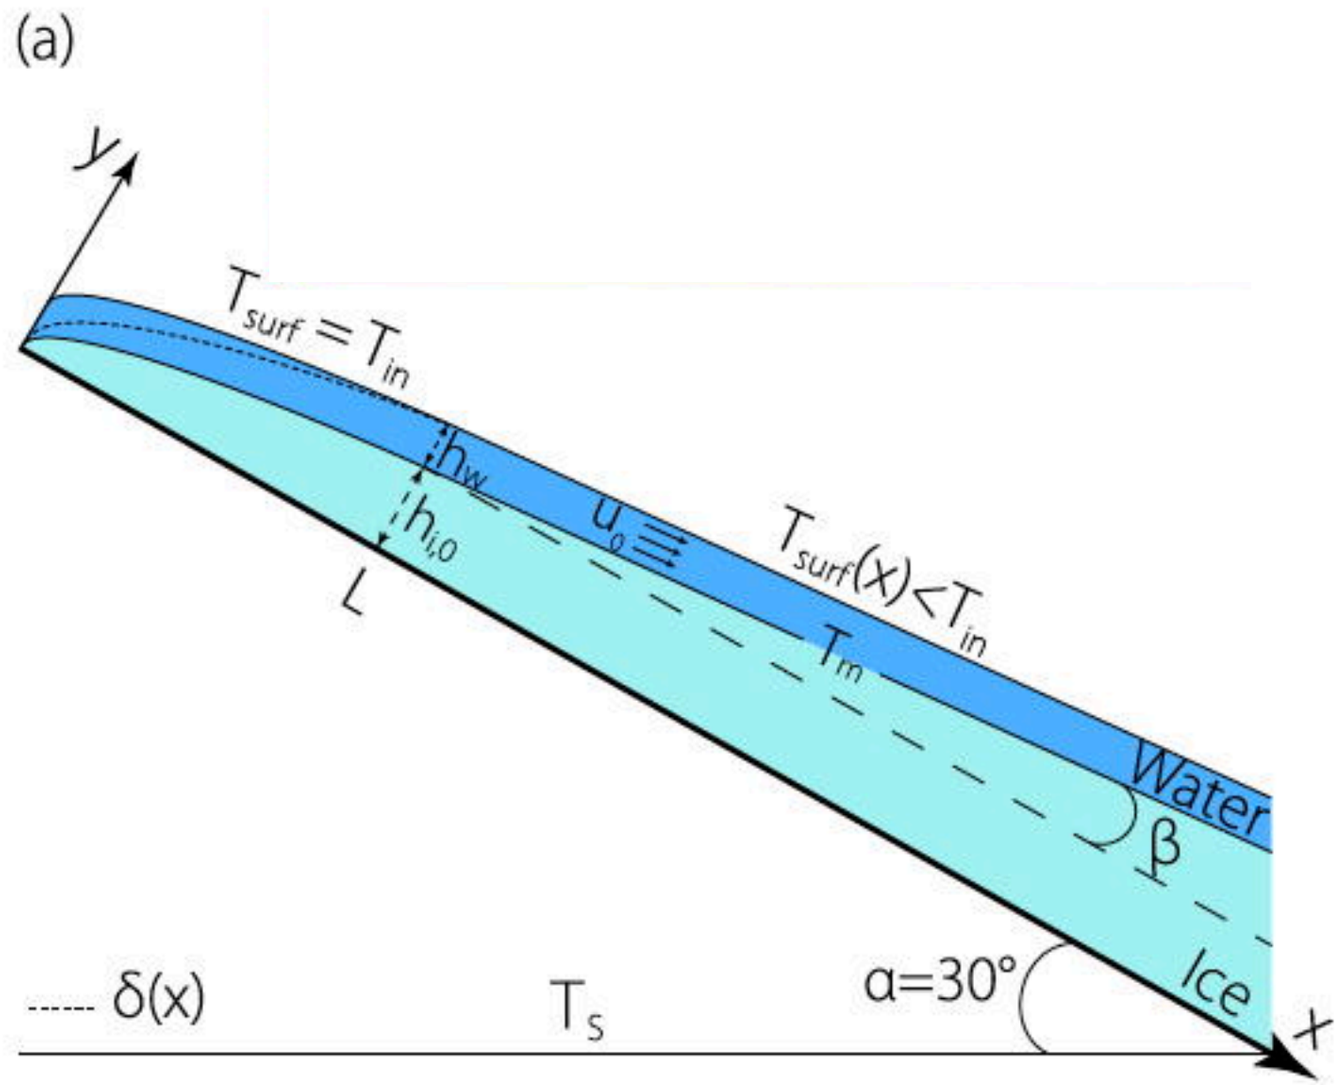
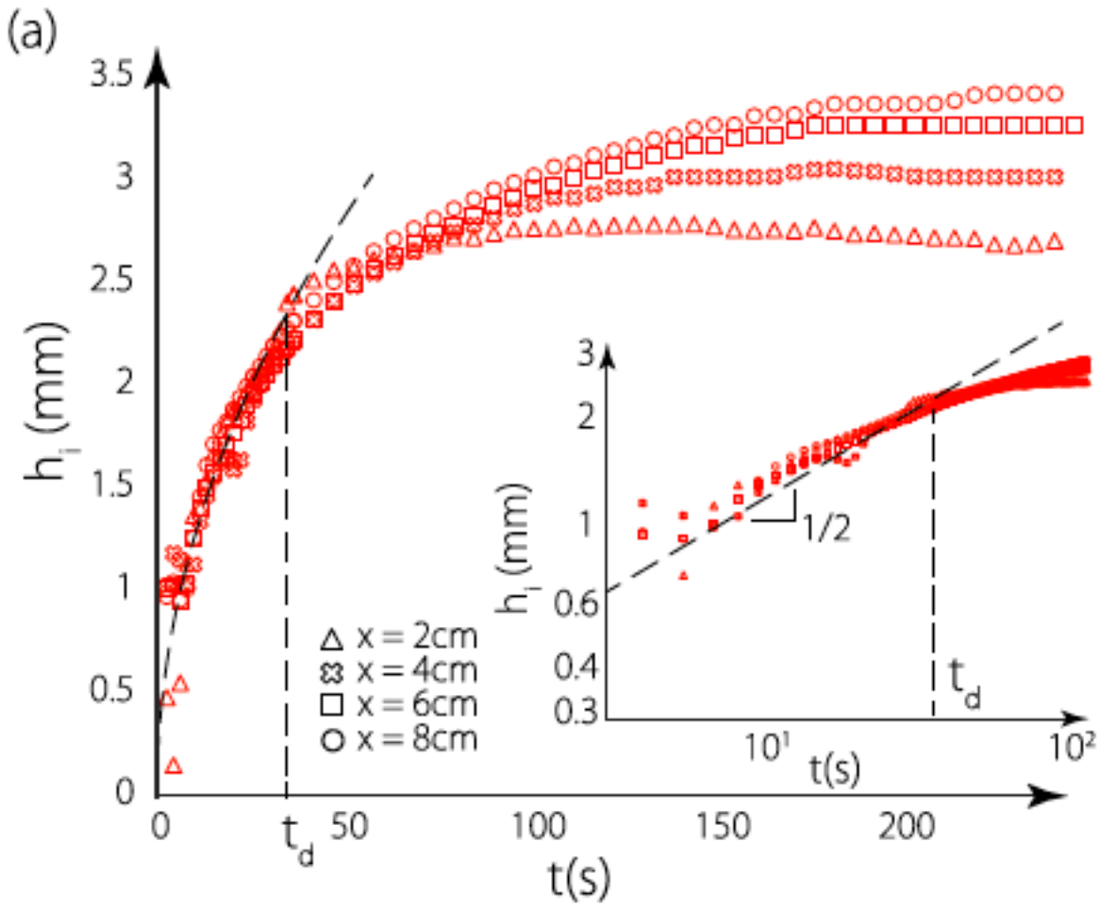
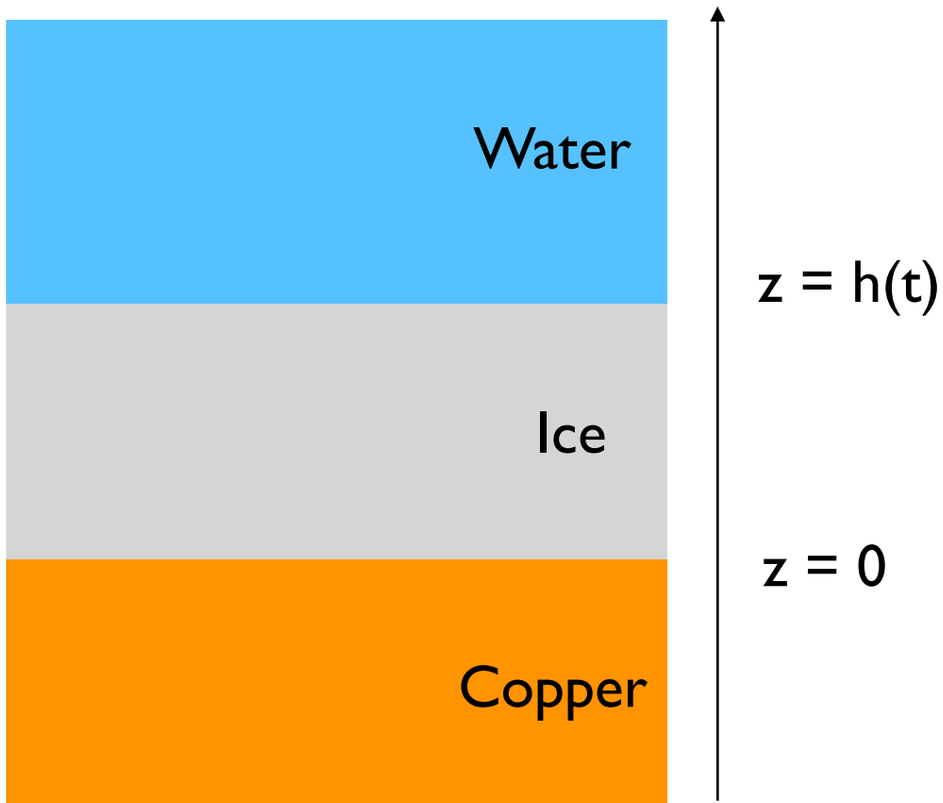
Freezing rivulet



Freezing a rivulet, A. Monier et al., *Phys. Rev. Fluids*, **5**, 062301 (2020)

The freezing rivulet problem, initial growth of ice layer





a simpler 1D geometry

Write the heat transport equations in the substrate and solid phases (assume isothermal liquid phase).

Write the boundary conditions at the substrate/solid [z=0] and solid/liquid [z=*h(t)*] interfaces

Rewrite the equations with a rescaled space variable

Find the self-similar solutions of the heat equation

Thiévenaz et al., *J. Fluid Mech.* **874**, 756 (2019)

The freezing rivulet problem: physical parameters

Liquid water (at 0°C) :

thermal conductivity λ_w = 0.6 W/m.K

heat capacity C_w = 4.2 10^3 J/kg.K

heat diffusivity κ_w= 1.2 10^{-7} m^2/s

Latent heat of freezing : L = 3 10^5 J/kg

Ice:

thermal conductivity λ_i = 2 W/m.K

heat capacity C_i = 2.0 10^3 J/kg.K

heat diffusivity κ_i= 1.12 10^{-6} m^2/s

Substrate (copper):

thermal conductivity λ_s = 400 W/m.K

heat capacity C_s = 385 J/kg.K

heat diffusivity κ_s= 1.2 10^{-4} m^2/s
